Category:Internet Protocol based network softwareQ: A navigation bar is not working when using IPython.display.display(data) I have an IPython notebook cell as: for i in range(10): x = np.random.rand(10,10) data = [i,x] import IPython.display IPython.display.display(data) However, when I try to use the display function in IPython, the navigation bar on the top disappears and the x variable doesn't show up. I found the problem was that the display() function is not compatible with the shell, so I need to use something like: import IPython.display IPython.display.display(data) I want to use display function in IPython, so that I don't have to write 'import IPython.display' everywhere. How can I fix this? Thanks A: From the documentation: Notice that display() is not a function to be used by users directly; it's a function to be used by IPython.display.display(). To be specific, display() can only be used to display a single object or collection of objects. In contrast, display() can be used to display any number of objects at once. To display multiple objects, consider using display_source(). That is, IPython.display.display(object) is not a function to be used by users directly; you need to use IPython.display.display_source(object). //-*- mode: c++;-*- /*****
