The calculation methodology used by the National Statistics Office to project total employment Burning down the wrong house: a study of fire damage to residential buildings in an inner city of Beijing. Fire is one of the most common hazards in everyday life. However, due to its nature of multiple risks, its dangerous consequences are not well understood. In the context of fire and safety issues of the urban environment in China, this study assessed fire damage of residential buildings in Beijing. The data of fire damage to residential buildings in 2015 in Beijing was obtained from the Beijing Bureau of Fire Prevention and Control. It is found that total fire loss accounts for 26% of the residential buildings in Beijing, and fire damages contribute to 17% of the residential buildings in 2015. It is significant that the total fire loss and the damage of the total number of residential buildings are all the highest in December, which is not the usual fire season of fire. At the same time, indoor fire still occurs in December, in which fire damages due to a house fire are the highest in December. These results suggest that house fire prevention should be paid attention to in the future. # \$Id\$ # Authority: dag # Upstream: m0n %define perl_vendorlib %(eval "%{__perl} -V:installvendor 2d92ce491b
