Category:Windows multimedia software you need to call the GetFileSize function to get the true size, which is the size of the actual file on disk. In this case, the actual file size is 41MB. Next up is the ReadFile function. This function will read from the file and copy all the contents of the file to the given buffer. In this case, the buffer has a size of 21,096, or 4096 bytes. The two functions will read all the contents of the file into memory and then write them to the specified destination, in this case the file out.txt. After that, we are back at the end of the function and we are ready to return. To summarize, we have loaded a file from disk into memory, copied the contents of the file into memory, and then written those contents to a file on disk. In this case, we have written 41MB worth of data into an out.txt file on disk. Step 6: Writing an XML file Now that we have written some data to a file on disk, we can write some XML. For this example, we will write a simple XML document to a file called app.xml. We will use the classic style of XML writing. For this example, we will write to a file called app.xml. This is our project's main class's main function's main function, so I am using the XML API directly. We have some interesting decisions to make in this function. First, we will write the document's opening XML tag. The tag that we use is section as well as this attribute. Our XML document is stand alone. Then we
