discriminate in employment, housing, and access to education and credit, regardless of race, color, sex, sexual orientation, . This time, the Bible uses the word proselyte instead of Jew, which denotes. They are a part of the Israelites, who are sons of Abraham, but .

DEFINITION OF THE PROTESTANT CHURCH OF GHANA.

The constitution forbids religious discrimination, stipulates that individuals are.

Distributed linear-time amplification from a quantum memory to an EPR pair. Quantum teleportation requires the ability to perform certain quantum tasks within the linear time of the one-way model. We investigate whether this linear-time amplification of quantum information can be achieved in a distributed way. In this approach, multiple parties (Alice, Bob,...) are provided with access to a quantum memory of fixed size, and the distributed protocol allows each party to teleport a quantum state stored in the memory to a remote party without ever interacting with it directly. Moreover, as the teleportation is distributed, the overall process is more resilient to noise and easier to accomplish. Using techniques from quantum cryptography, we show that a distributed protocol where Alice is able to teleport her qubits to both Bob and Carol and then return them to Bob and Carol,

respectively, is possible. The invention relates to a bearing comprising a sleeve which has a bearing ring provided with a number of angularly spaced, cylindrical guide grooves. A known bearing of this type is described in DE 43 03 052 C2. This bearing comprises a bearing ring and a sleeve rotatable relative to the bearing ring. The bearing ring is provided with six outwardly directed, angularly spaced, cylindrical guide grooves on its outer peripheral surface. Between two diametrically opposite guide grooves there is a radially outwardly extending pocket with a bore which communicates with the guide groove and which receives the opposite guide groove and the bore. In the region of the end faces of the bearing ring there are holes which communicate with the bore and are supplied with lubricant. The lubricant is taken in by means of the centrifugal force caused by the rotation of the bearing ring. The two guide grooves nearest the end face of the bearing ring are connected with one another by a sealing ring which is pressed against the end face by a spring force. The sealing ring seals the pocket against the bearing ring and has a small surface which prevents it from being pressed into the material of the guide groove. The rest of the guide gro
