Q: How to check the presence of a variable from parent scope? I have a task - to pass user data in current scope. I am passing data by using another variable in other scope. My problem is - when I want to access that variable from inside of callback I am getting error Error: ReferenceError: test is not defined What should I do to access that variable? Tested with: chrome firefox safari Test code

```
test var test = 3; window.parent.functionName = function() { callback(test); }; functionName(); function callback(test){ document.getElementById("current-test").textContent = test; } I appreciate any help, because I am starting in programming field.
```

A: The scope is restricted to the callback function. Inside the callback function the variable test has not been declared. You have to use the callback function arguments:

```
window.parent.functionName = functionName = function(test){ callback(test); }; functionName();
```
