At a glance: PDF import PDF import Improved curve objects Geometric entities are more quickly drawn and combined to produce coherent shapes. Ability to edit measurements on spline curves. Curve splines can now be set as the basis for spline surfaces. The polyline curve spline object is now a parametric surface object. Improved Polyline: Edges can be made up of curves, line segments, and arc segments The new Polyline object is a parametric surface object. This means you can create simple shapes on a line, then curve the line to create a shape or a spline surface, without the need to create a surface patch first. Curve objects: The shape of the curve is no longer constrained to be a straight line The curve object can be placed in the geometry and rotated The curve object can be modified to any shape, including a circular arc The curve object can be manipulated with the 3D toolbar Shape handling commands are easier to use with the curve object Spline objects: The spline object can have any number of branches The spline object can also be closed with a single spline The spline object can be rotated in 3D If you're new to the Draw tab, check out our tutorials or follow this link to learn how to get started.
