Privacy Policy and Cookies? March 31, 2019. KL International Program - International Student and Scholars Home Page Page 1 of 7..1. Field of the Invention The present invention relates to a continuous track type slotless linear motion rolling guide unit that includes a raceway member, a slider, a plurality of rolling members disposed between the raceway member and the slider, and a plurality of link bodies each having a pair of raceway grooves and a pair of rolling grooves for engagement with the raceway grooves and the rolling members. The raceway grooves and rolling grooves are arranged alternately in a direction of movement, whereby each of the link bodies is divided into a plurality of blocks of equal weight and a plurality of unbalanced link portions of equal weight are present between the blocks. 2. Description of the Prior Art Conventionally, this type of continuous track type slotless linear motion rolling guide unit is disclosed in Japanese Unexamined Utility Model Publication Nos. Sho 63-58199 and Sho 63-100,012. Each of these conventional units has a plurality of rolling members disposed between a raceway member and a slider, each rolling member having a pair of raceway grooves and a pair of rolling grooves for engagement with the raceway grooves of the raceway member and the raceway grooves of the slider. The raceway grooves are arranged alternately in a direction of movement of the raceway member, while the rolling grooves are arranged alternately in the direction of movement of the slider. In each unit, each link body is divided into a plurality of blocks of equal weight by means of a punch or a die. A first block is provided with an unbalanced link portion disposed between the pair of rolling grooves, while a second block is provided with an unbalanced link portion disposed between the pair of rolling grooves. In this manner, since the first and second blocks are provided with the unbalanced link portions at the same intervals, the total weight of each block is equal to the sum of the weight of the link portion and the block, so that this type of linear motion rolling guide unit has a feature of no weight balance. In the case of the conventional unit above described, only one block is provided with the unbalanced link portion, and therefore
