AutoCAD has advanced in many areas and has become a multi-platform, multi-user application with many different use cases. The core of AutoCAD's features are very robust and capable, even though AutoCAD is not the fastest or most feature-laden application available. Rather, AutoCAD has a complete library of commands, functions, features, styles and much more than any other CAD program. The good news is that AutoCAD is easier to learn than some other CAD programs. You can draw in AutoCAD in less time than you need to learn to use another CAD program. There are a large number of training videos on YouTube, and even an in-depth new user's guide that can be purchased from Autodesk. Additionally, there are many very informative podcasts, how-to videos, and tutorials for Autodesk products on YouTube, on Vimeo, and even by subscription through certain CAD magazines. AutoCAD Basics AutoCAD is a powerful and capable product. While AutoCAD is not the fastest, fastest CAD program on the market, the core of AutoCAD's functions are very powerful. An AutoCAD user should be very comfortable with the most basic and necessary operations of the application. They should have a general understanding of how to select and create objects, shape objects and perform basic drawing functions such as creating, moving, rotating, linewalling, and labeling objects. It is recommended that AutoCAD users also have a basic understanding of other concepts related to CAD such as dimensioning, positioning, creating and editing text, creating and editing tables, creating symbols, creating and editing equations, and plotting data. AutoCAD is not the only CAD program on the market. There are a number of very similar programs available, including AutoCAD LT (formerly AutoCAD LT), AutoCAD Standard, AutoCAD Premium, Autodesk® Inventor® 2019, and Autodesk® Revit® 2019. AutoCAD is a complete package, meaning that it can be used for drafting and design, and modeling. It contains a vast library of built-in commands that can be used to create and draw almost any type of object. Many CAD programs have a large number of commands and functions, and have extra or supplemental features that are not necessary to use the program to complete a specific task. Rather, AutoCAD has a large number of commands that are very robust and capable to enable

Q: How to bind methods to an event (WPF) I've been searching and reading some articles about how to bind to an event from a base class, but I'm not sure I understand everything correctly. So my scenario is like this: I have a base class that I'll make a list of in my main form. It is a button, and I want to bind to the click event of it. I'll then display a toolkit window to the user and let them select what type of button they'd like to be. The problem is, I want to give them a standard click event, but I want it to call the method in the base class that takes in a string argument. The code looks like this:

```
public ButtonBase { //Events and the like public event EventHandler Click; public void OnClick(object sender, EventArgs e) { EventHandler h = Click; if (h!= null) h(this, e); } public string Name { get; set; } } public MyForm { public ButtonBase Button1 { get; set; } }
```

 This doesn't compile as the compiler can't find the get and set for the Name property. I'm guessing it's because it's in the base class, rather than the derived one? So is there a way of solving this, either using the events in the base class or something else? I've also seen things about custom
