IzPack is an easy to use graphical setup tool for Java platform applications. It offers a user-friendly environment for creating complex installation packages without the need to code in Java. The setup package can be created by using IzPack wizard or from scratch. An easy to understand interface is available to create a common package type, or to create one of the standard package types like Setup.exe, MSI, or OCX installer. The application uses the Open Install standard, which is a standard that allows creating install packages from the Java platform, independent of the Java Runtime Environment used on the target machine. IzPack provides a vast number of features for creating customized package types, and the feature list is constantly updated. When creating a package type, the user has to consider what packages are needed and how they are to be placed in the package. Installing packages can be done manually from a list or automatically. A catalog of packages can be used. The user can select the type of package generated and the type of operation of the package. The user can also choose what kind of dependency is to be created between packages. The environment variables can be managed and values specified before the package is created. Package structure can be defined by using IzPack Wizard. If a package is created from scratch, the packages can be compiled from the Java platform. Creating a package from scratch involves no coding. Instead, the wizard asks a few questions that help create a package that works for the given installation. Package dependency or package resource can be created automatically or manually. Before a package is created, the user can select a catalog that lists all installed packages. IzPack packages can be run with IzPack itself, but they can also be run by PackJacket, which is the IzPack default application for Windows.
