The application's main feature is to display a keyboard macro. It works like a virtual one, acting as a macro recorder of your choice. There are two modes of operation: editor and shell. When you are in the editor mode, you will not be able to make any changes to a document, but only record keystrokes. On the other hand, when you are in the shell mode, you can both record and edit. KEYMACRO has a highly customizable input and output system. If you have different keyboards with different layouts, the application allows you to add or remove the ones that are not used, change keyboard shortcut assignments, or configure any other configuration you see fit. Also, you can customize the operation of the keyboard macros. For example, you can assign a shortcut to the "Remove First Character" command. For maximum flexibility, you can also define any number of buttons or modifiers, as well as, the output format to any of the following: text, file, variable, list, row, and cell. Finally, there is a built-in system of searching and filtering. If you want to run a search with keywords, whether you want to select all documents that contain a keyword or search based on specific attributes, KEYMACRO can accommodate your wishes. To sum up, this application has a pretty powerful list of features, to be honest, I don't know how it compares to other applications. You can change the output format, the keyboard shortcut assignments, add or remove buttons, modifiers and the like, without ever having to leave the GUI.
