The primary polymerization of acrylic acid in the presence of the Lewis base

pentylpyridine has been studied by high-temperature titration experiments. We have obtained concentrations and extinction coefficients for the acidic monomers, and the apparent activation energies for the corresponding initiation steps in the hydrolysis of the corresponding carboxylic acid. The observed rate coefficients, k_p, can be rationalized by associative mechanisms. We obtained equilibrium constants, K_{eq}, for the formation of the neutral dimer from the ion pair; these were extrapolated to the

absolute 0 K with the aid of free energy corrections obtained from high-temperature ionic strength dependence measurements of the equilibrium constants. On the basis of our results, the apparent activation energy for the formation of the neutral dimer from the corresponding ion pair is estimated at 150 +/- 40 kJ/mol.Q: Convergence of the Euler gamma function Does the Euler gamma function converge? $$\Gamma(a) = \int_0^\infty x^{a-1}e^{ -x} \, dx$$ $$\lim_{a \to \infty}

$$\Gamma(a) = \lim_{a \to \infty} \int_0^\infty x^{a-1}e^{-x} \, dx = e^{-x} \Big\rvert_{0}^\infty$$
$$\lim_{a \to \infty} \Gamma(a) = \lim_{a \to \infty} \int_0^\infty x^{a-1}e^{-x} \, dx = 1$$

I am familiar with the definition of the gamma function, but I was under the impression that infinite series of integrals do not converge. If this is the case, is there a proof of the convergence of this function? Thanks in advance!

We hypothesized that successful coronary angioplasty (PTCA) results in an early as well as a late inflammatory response leading to myocardial remodeling. In this study we investigated interleukin-1 (IL-1),

IL-6 and tumor necrosis factor alpha (TNF-alpha) concentrations during the first week, and 9 months after PTCA in patients with acute myocardial infarction (AMI). Plasma levels of TNF-alpha, IL b7e8fdf5c8
