## ErrorList Product Key Full

Errors and warnings shown in the Error List window are generated when developers use JSR-309 annotations (f.e.: @Mention or @Visible). These annotations are applied to certain members and methods, but cannot be used to decorate every method and member of a class. In this case, the application will produce a warning or an error, depending on the severity of the problem. The Error List plugin, by working with the messages generated by these annotations, will highlight them. The plugin has two main modes: \* List all the errors and warnings generated in the editing process \* List all the errors and warnings in the entire project \* List only the errors in a specific package (if the package is selected) The plugin will highlight the lines where warnings/errors have been generated. It's possible to filter the results with an additional text, so that only the wanted messages will be highlighted. The use of Error List is easy. You just highlight the desired lines by typing the markdown shortcut (ctrl+shift+l) and you can simply exclude a line with a single backspace. The Error List plugin by Hugo Giraudel. This will also highlights the messages generated by JSR-309 annotations (f.e.: @Mention or @Visible). Features include: \* Live error and warning highlighting for many open tabs \* Highlight all the generated errors and warnings in the editing process \* Highlight all the generated errors and warnings in the entire project \* Highlight only the errors in a specific package (if the package is selected) \* Exclude an error or a warning \* Type filtering \* Text filtering \* Filter result based on the severity (severity is determined by the developer) \* Live and auto-update \* Retrieve the error type, message and line number from the XML error/warning files See the full list of features in the FAQ, by clicking [here](#). If you like the plugin, help us making it better by reporting issues and/or submitting fixes, and don't forget to star it! Features include: \* Live error and warning highlighting for many open tabs \* Highlight all the generated errors and warnings in the editing process \* Highlight all the generated errors and warnings in the entire project \* Highlight only the errors in a specific package (if the package is selected) \* Exclude an error or a warning \* Type b7e8fdf5c8

## ErrorList

===== - **Old (fully compatible) version:** .. image:: - **New (with debug messages) version:** .. image:: - **Limitations:** - If you are using GNU/Linux, ErrorList will not work unless you create the file `/etc/xdg/menus/jedit-2.0/applications.menu`` (or whatever you name the file). This will prevent jEdit to open in fullscreen. - If you are using Windows, ErrorList will not work unless you set ``$JAVA_OPTS -Djedit.useTrace=true``. This will display in the console more debugging information. - **Download:** - `!`` - **Installation:** - **On Linux:** - Install ErrorList, using ``sudo apt install errorlist`` - Download jEdit and add ErrorList: ``jedit-2.0.0-3.1-RSS-jeditable.jar`` to ``$JAVA_HOME/jre/lib/endorsed`` (and create the ``/etc/xdg/menus/jedit-2.0/applications.menu`` file if necessary) - Copy `

## What's New in the ErrorList?

===== This plugin will highlight all the Javadoc, package declaration (ex: Introspection) and method declaration (ex: public int) warnings for all the files opened in jEdit. Features: ===== It takes advantage of the `%javadocskip` and `%javapackageskip` operators, in order to avoid highlighting the errors. By default, it will show both the warnings and the errors, but the options "show" and "only errors" are available. How to install ErrorList: ===== - Copy this.jar in your plugins folder (see "jEdit-plugin-plugins" in your jEdit installation directory) - Launch jEdit - Click on Plugins > Save plugins - Type: "ErrorList" - In the version option, select "22-Sep-2013" - Click on "OK" The plugin will be installed You can now highlight the errors with the standard highlighting of jEdit, the only added constraint is that it will automatically switch to the ErrorList warnings. Known issues: ===== You can't yet highlight the errors with the color of the background of the file (that's a color of this plugin), but it will be resolved soon. It may occur that jEdit crashes after stopping it, this is due to a bug in jEdit 5.3 and which has been fixed in jEdit 5.4. To avoid this, you can close jEdit after a few seconds. License: ===== You can download the plugin here: Do not hesitate to send us your modifications and improvements. This project is still not closed. We just need more contributors... 2) Please visit this following link and sign up for version updates for major new features in releases: If you want to help us by
