It is the first software which connects your computer to the binaural beats network and allows you to get the most out of your connection. Gnaural supports you to achieve a deeper connection to the binaural beats network by revealing the track history, and the full history of the current session. It helps

you visualize the phase pulses of all the tracks and easily keep track of the time in the binaural beats network. Gnaural offers a very diverse set of features to get the most out of your computer connection. - Use the Haazmi's new EEG cap (released later) - Automatic uploads of the EEG data to the Binaural Beats network - Fills in

missing data with the PCA algorithm - Shows the evolution of the EEG over time - Transfers binaural beats into the memory of your PC - It provides a complete EEG visualization and analysis of your dataset - Detailed history of the currently logged session - Fills in the gaps in time of sessions (up to 2000 pages) - Shows the phase pulses

during a session -
Automatic extraction of
the pulses - Provides a
PCA analysis of your
dataset (PCA analysis is an
algorithm that creates the
best representation for the
data while keeping the
amount of data as low as
possible. The lower the
representation, the more
information it will keep
about your data. PCA can
be seen as a reduction of

data) - Data visualization of the data - Detailed information about each track - It allows you to filter the tracks by frequency and amplitude - It allows you to stop the session - It allows you to export the data in wav, in any other format (freedb, flash,...). - If you already have a dataset, you can run the program by adding the data, with the personal

ID and a password, then it is simply treated as an external file. - It has a graphical user interface. It can be used on Windows, Mac OSX, Linux Use the Binaural signal generator as a live music player by setting up the latency and the sample rate. User interface At first start Gnaural is a program window, and an information window

appears when you select the “Listen” button. When you play a binaural beat or stereo music, you will get one or two green buttons next to the main window. These buttons allow you to adjust the stereo balance, latency and sample rate

After clicking on the mode button (if required) it will begin to generate the selected

program. When it comes to the frequencies you can change it from 80 Hz up to 3 MHz, while the option of a sweep which results in frequency increasing in the middle and decreasing at the ends is offered. The complete documentation is included in the program. Gnatural is a freeware that runs on Windows XP, Windows Vista, Windows 7, Windows 8, and

Windows 10. New features: * Now it is possible to have different frequencies for each beat in the program. This can be done via changing the binaural beat mode or by changing the beat frequency for each beat in the program. * Now it is possible to select any sound tone for any beat you can select from the list. * Now it is possible to

create sequences of beats that are based on time. * Now it is possible to start the program from the SD card. * Now it is possible to change the pass-through mode. * Now it is possible to set the beat rate to any value, no longer limited by 80, 120, 160, or 200 bpm. * Now it is possible to set the beat interval to any value, no longer limited by 2, 4, 8,

10, 12 or 14. * Now it is possible to save and load the specified beat programs to/from the SD card. * Now it is possible to load each beat via all the selected voices (see the option “all the specified voices” in the “Beats” tab). * Now it is possible to specify the binaural beat frequency or you can use the whole frequency spectrum for

any of the selected beats.
* Now it is possible to
specify the binaural beat
volume or the whole
frequency spectrum
